

Domain-Specific Language for Epidemiological Modeling

Bui Thi Mai Anh, Benjamin Roche, Serge Stinckwich, Ho Tuong Vinh, Mikal Ziane

Objectives

- Provide a DSL for epidemiology modelers
- Deterministic, Stochastic and Multi-agent Simulations
- Generate LaTeX (equations) , C or R (code) from models
- Reuse, validate, share models between experts

Related Works

- **Ronald**: a Domain-Specific Language to study the interactions between Malaria infections and drug treatments (2008)

Compartmental Models in Epidemiology

$$\frac{dS}{dt} = -\beta IS$$

$$\frac{dI}{dt} = \beta IS - \nu I$$

$$\frac{dR}{dt} = \nu I$$

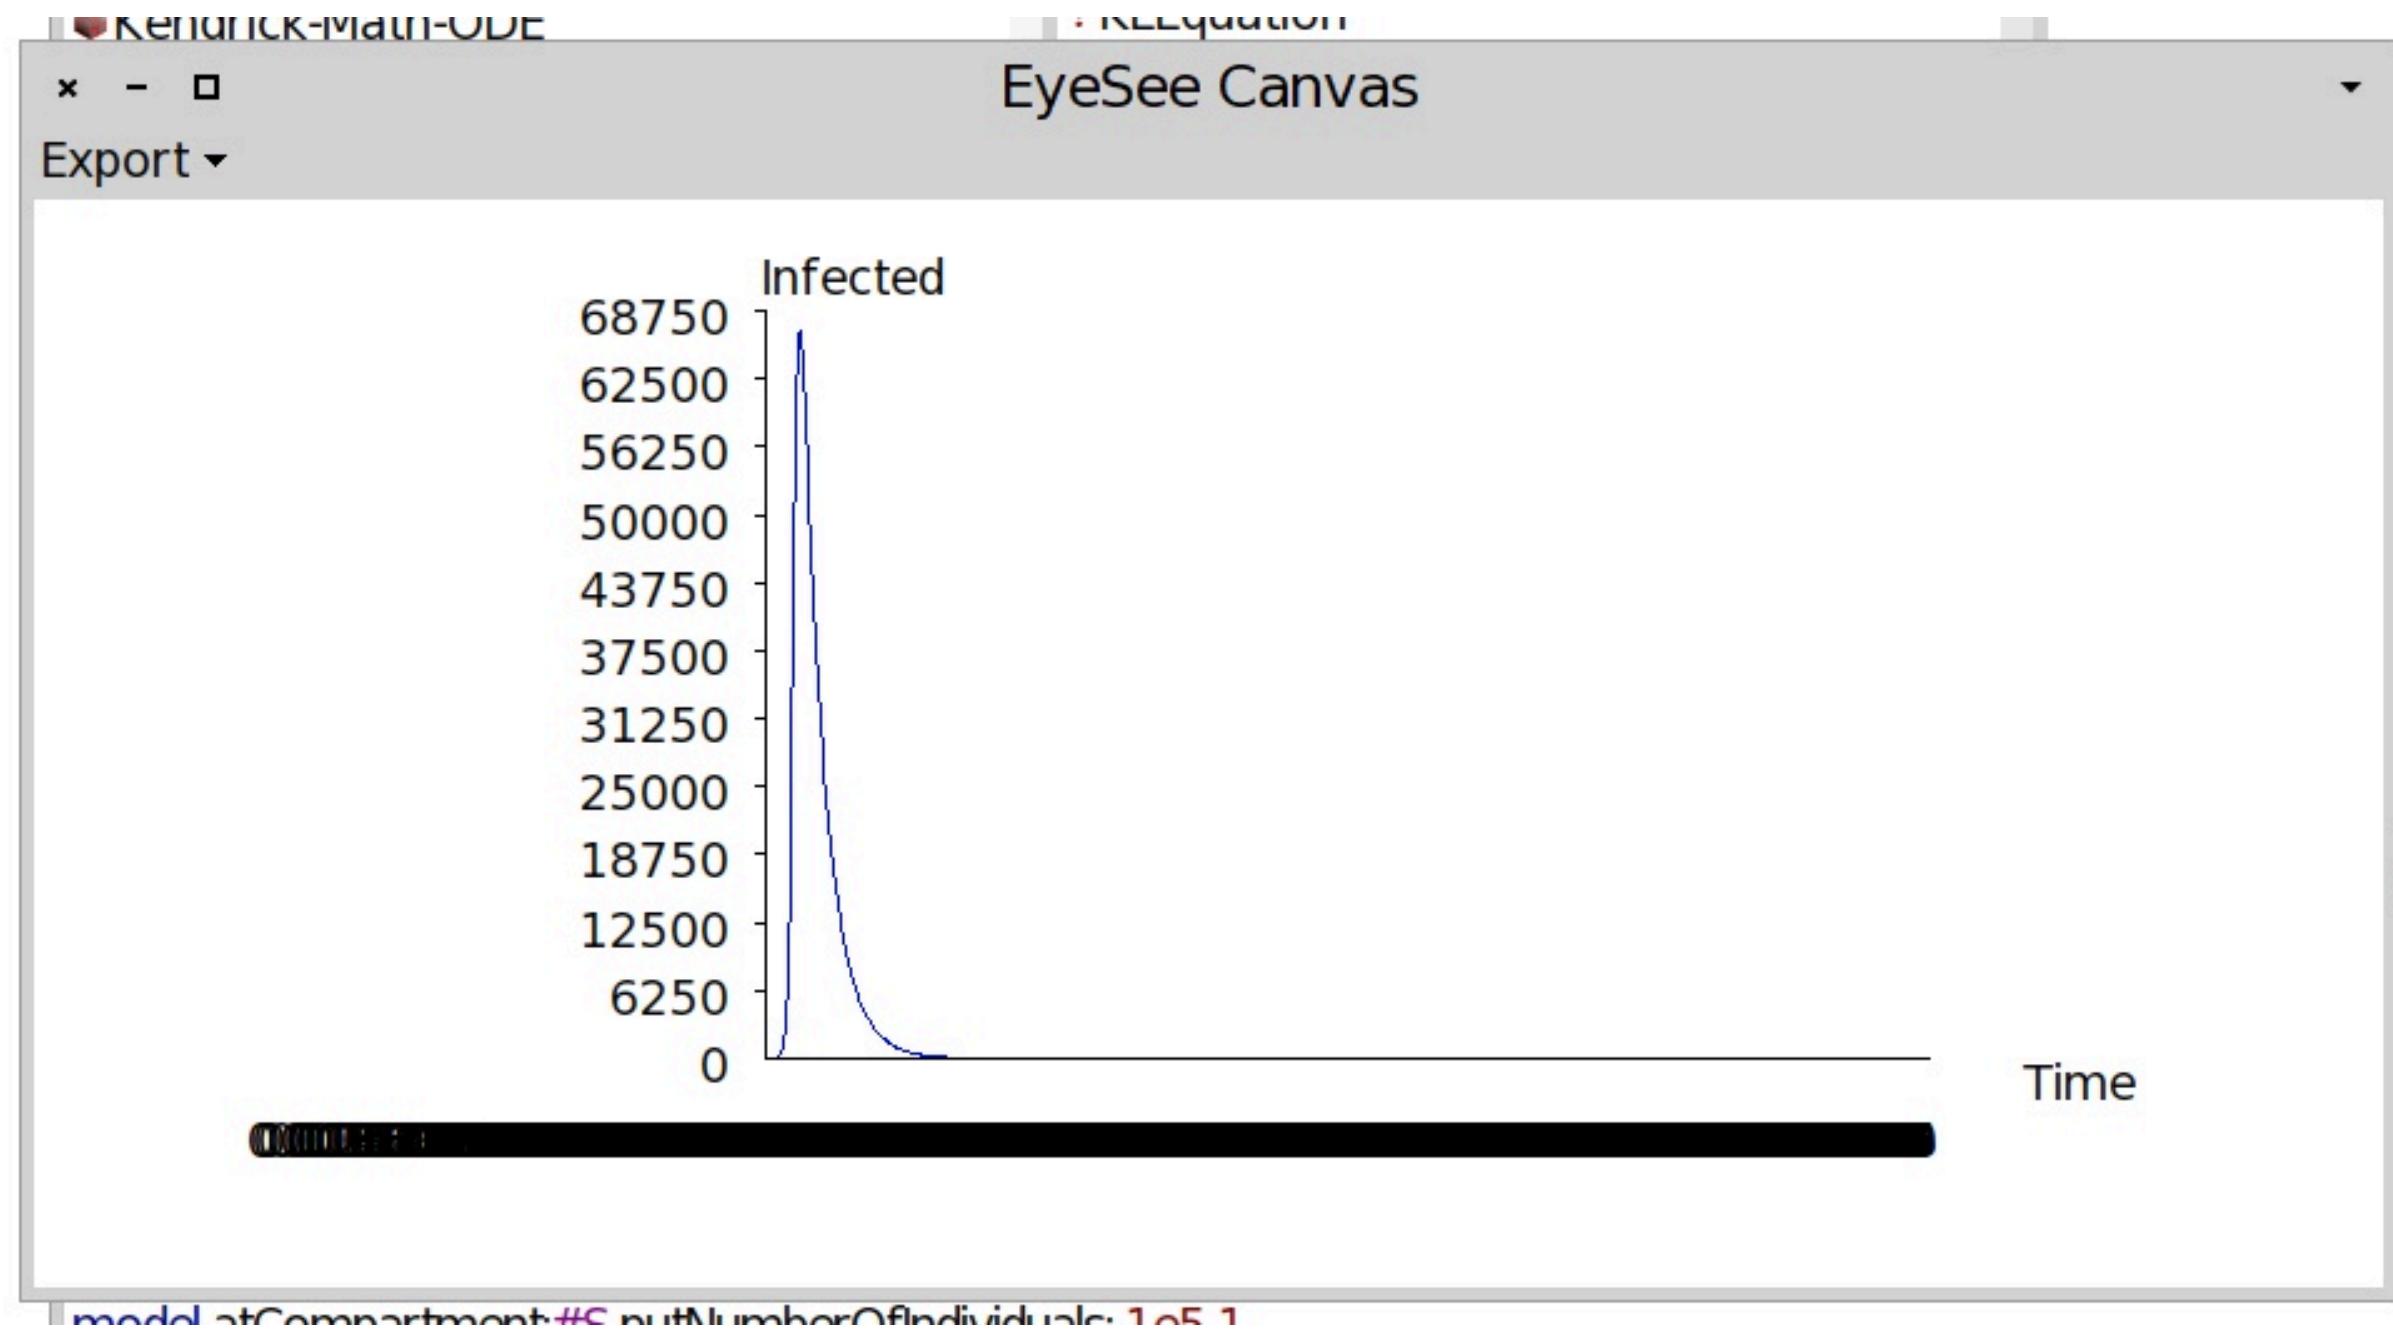

Measles (deterministic)

```
| model |
model := KEModel new.
model atCompartiment:#S putNumberOfIndividuals: 1e5-I.
model atCompartiment:#I putNumberOfIndividuals: I.
model atCompartiment:#R putNumberOfIndividuals: 0.
model atParameter:#beta put: 0.0052.
model atParameter:#gamma put: 365/7.

model addEquation: (PPODEParser parse:'S:t=-beta*S*I').
model addEquation: (PPODEParser parse: 'I:t=beta*S*I-gamma*I').
model addEquation: (PPODEParser parse: 'R:t=gamma*I').
```

model runDeterministSimulationFrom: 0.0 to: 1.0 with: 0.001.
model plot

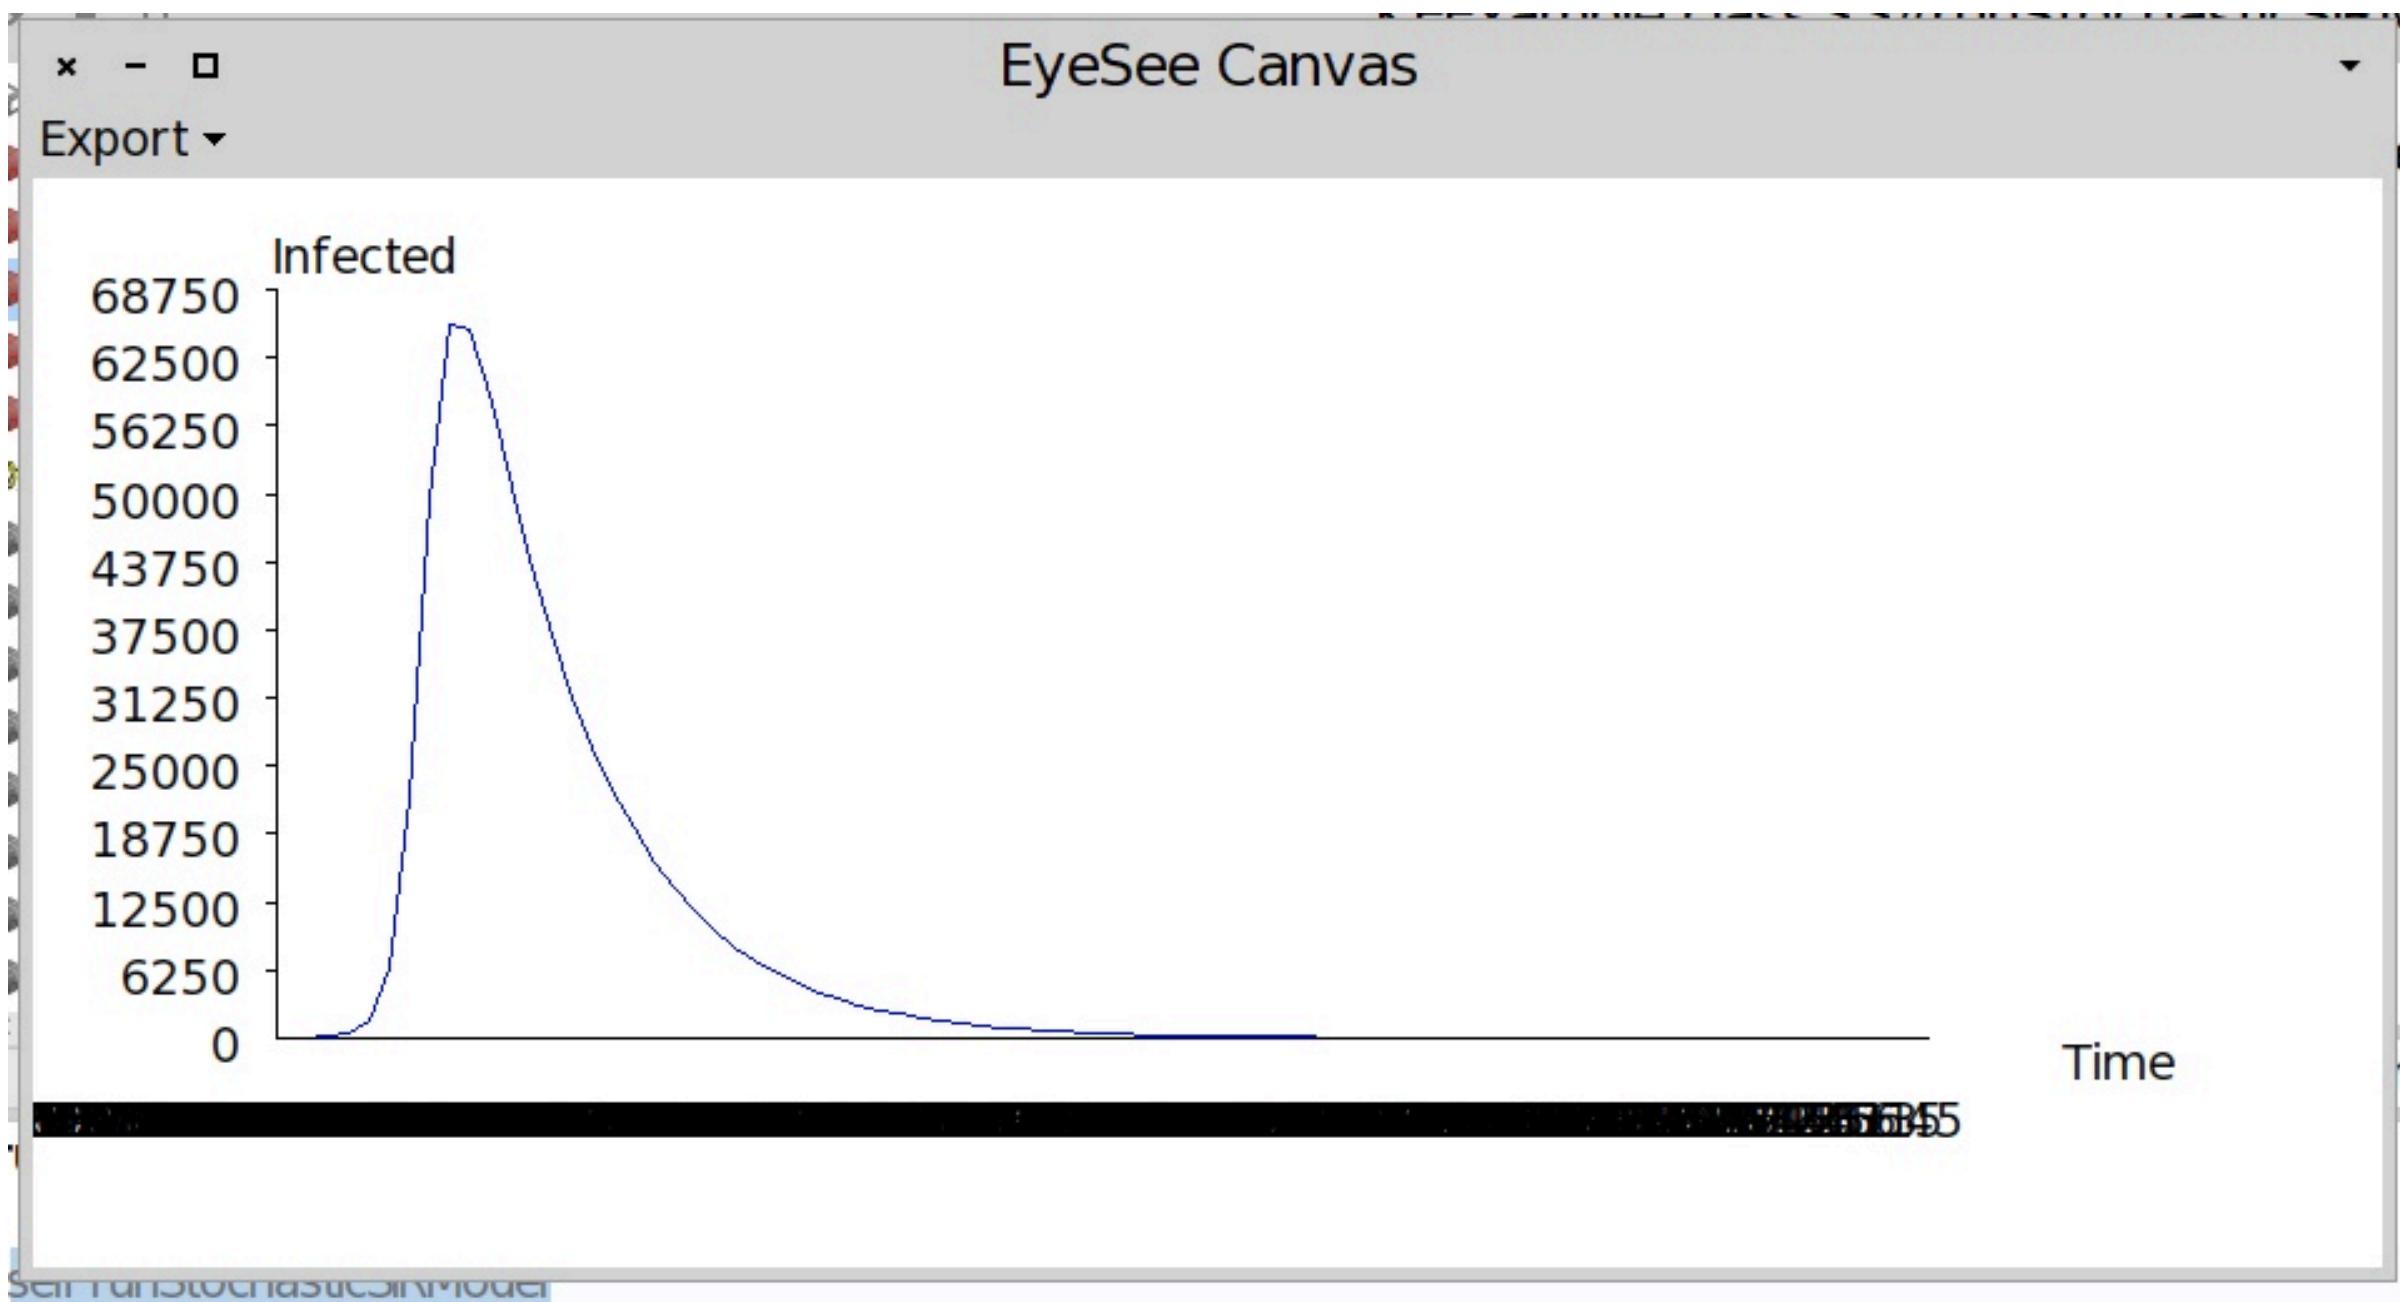

Measles (stochastic)

```
| model |
model := KEModel new.
model atCompartiment:#S putNumberOfIndividuals: 1e5-1.
model atCompartiment:#I putNumberOfIndividuals: 1.
model atCompartiment:#R putNumberOfIndividuals: 0.
model atParameter:#beta put: 0.0052.
model atParameter:#gamma put: 365/7.

model addEquation: (PPODEParser parse:'S:t=-beta*S*I').
model addEquation: (PPODEParser parse: 'I:t=beta*S*I-gamma*I').
model addEquation: (PPODEParser parse: 'R:t=gamma*I').
```

model runStochasticSimulationFor: (50/365).
model plot.

Multi-host example (deterministic)

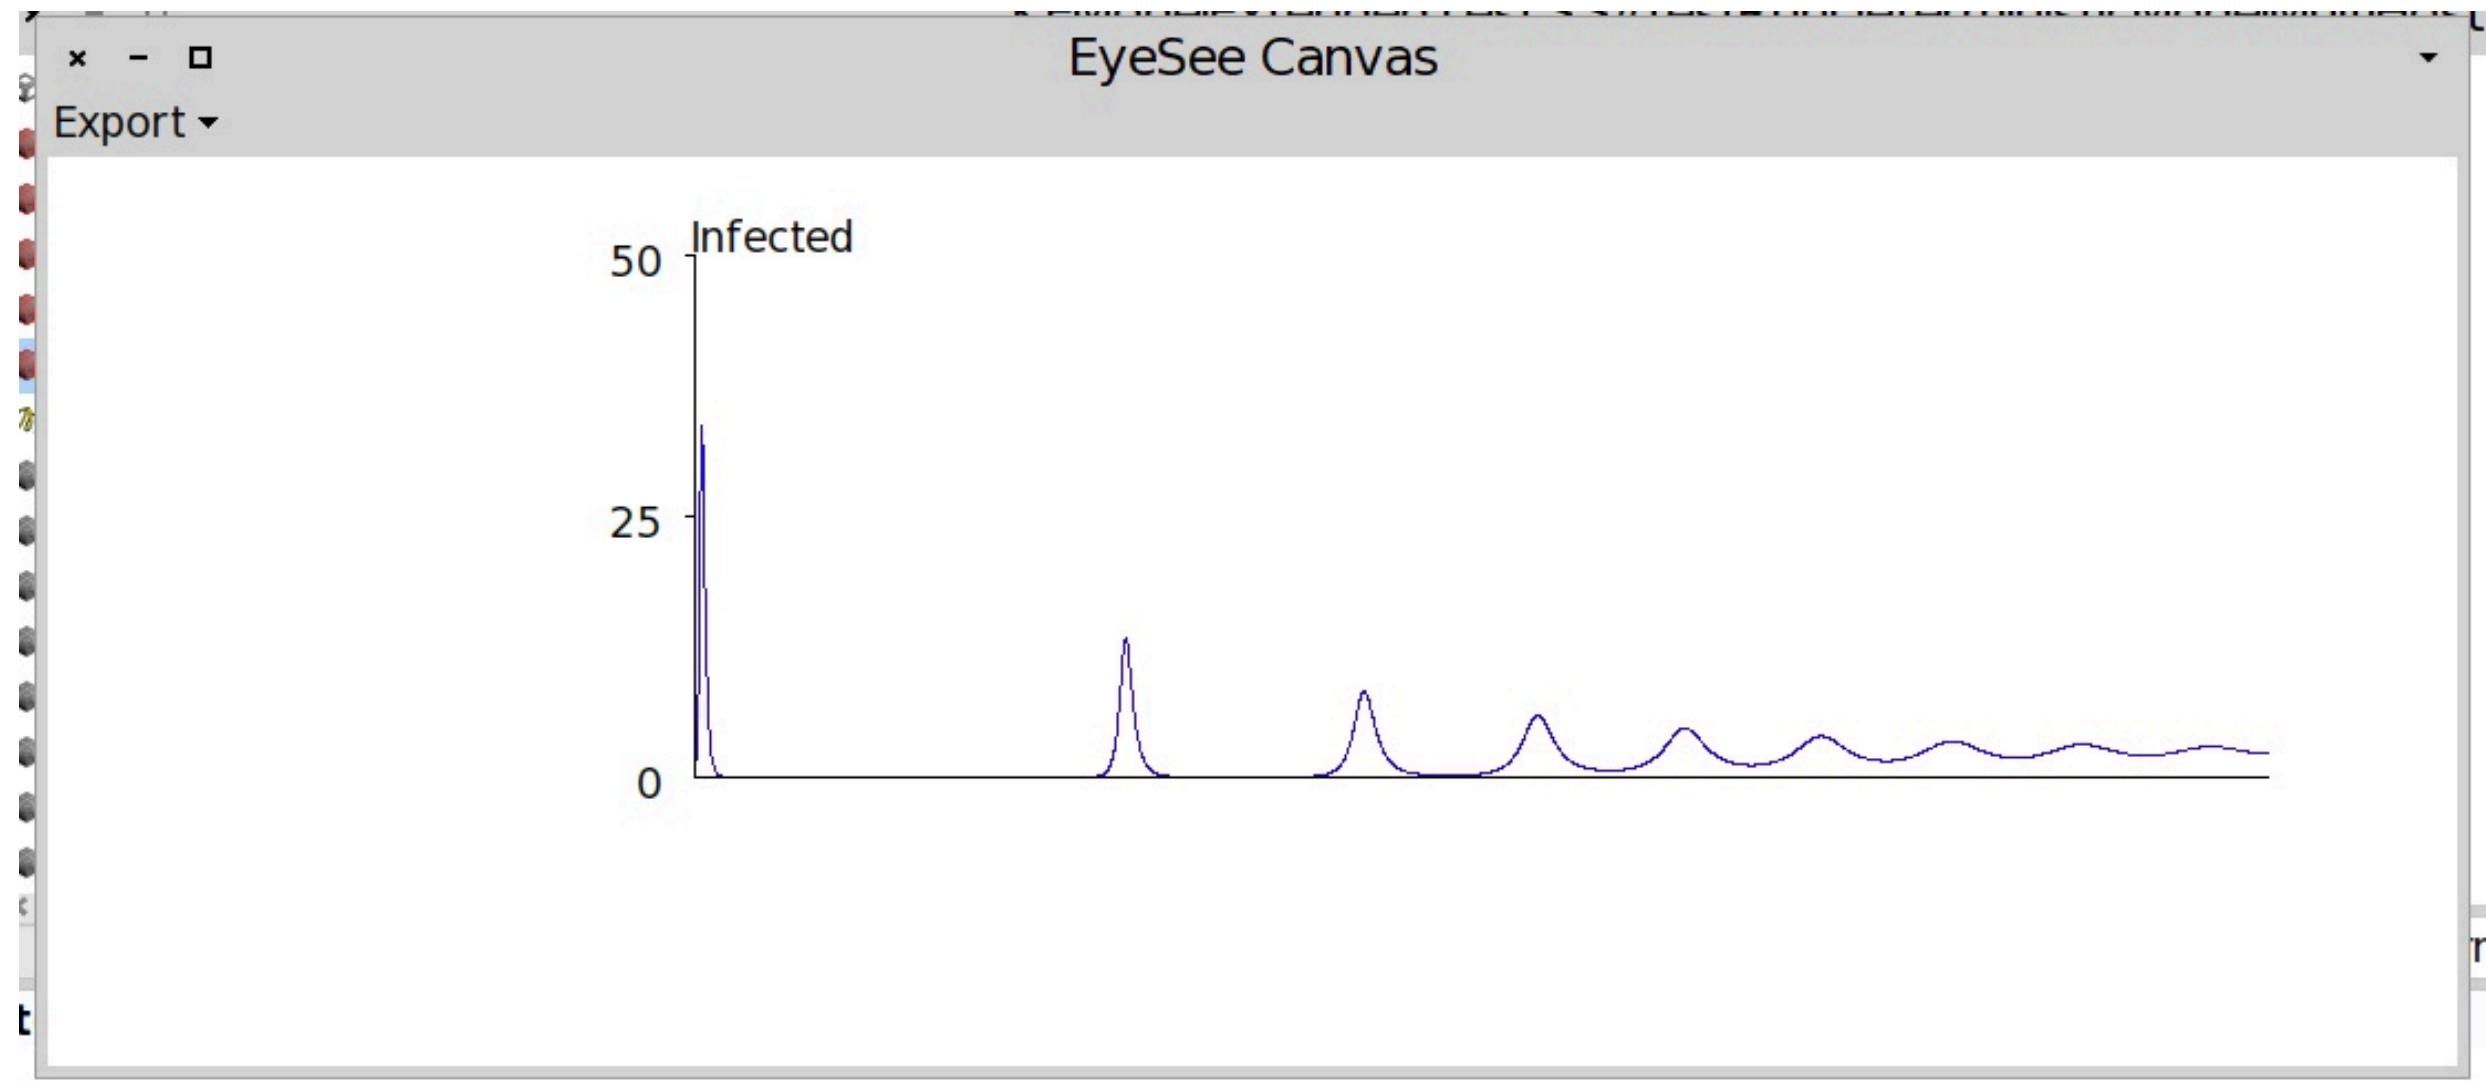

```
|model compartment dsdt didt|
```

```
model := KEModel new.  
model atCompartiment: #S putNumberOfIndividuals: #(9999 1000 2000).  
model atCompartiment: #I putNumberOfIndividuals: #(1 0 0).
```

```
model atParameter: #beta put: {{0 . 0.02 . 0.02} . {0.02 . 0 . 0} . {0.02 . 0 . 0}}.  
model atParameter: #N put: #(10000 1000 2000).  
model atParameter: #mu put: {365/30 . 1/20 . 1/20}.  
model atParameter: #v put: 52.  
model atParameter: #j put: (1 to: 3).  
model atParameter: #i put: (1 to: 3).
```

```
dsdt := 'S[i]:t=mu[i]*N[i]-sum(j, beta[i, j]*I[j])*S[i]-mu[i]*S[i]' parseAsODEEquation.  
didt := 'I[i]:t=sum(j, beta[i,j]*I[j])*S[i]-(mu[i]+v)*I[i]' parseAsODEEquation.  
model addEquation: dsdt.  
model addEquation: didt.
```

```
model runDeterministSimulationFrom: 0 to: 40 with: 0.01 function: #sqrt.  
model plot
```

Model ?

- Compartments (states)
- ODE (ordinary differential equations)
- Parameters

Solving Equations

- Set of non-linear ODEs
- No generic analytic solution
- **Deterministic** => Runge Kutta Solver, ...
- **Stochastic** => Gillespie Algorithm, ...
- **Individual** => Multi-agent system

Challenges

- Coherence/ validation
- Simulation parameters:
 - efficiency: solvers, ...
 - model exploration
- Adapt DSL to different kinds of users (practitioners, decision makers, ...)
- Decouple states & their structures ?
